Latest mobile-fix commit: 7bcb261 — fix: improve mobile readability and touch targets

1. What was changed

Area	Fix
Mobile spacing and layout	Responsive padding and spacing were adjusted so the portfolio remains contained and comfortable on smaller screens.
Mobile readability	Supporting text and form labels were given more comfortable sizing and line spacing for mobile reading.
Form usability	Form controls use a comfortable 16px text size and inputs/button have at least 44px interaction height.
Touch targets	LinkedIn, GitHub, and Email links use larger tap areas without changing the minimal visual design.
Accessibility	Clear focus-visible states were added for links, inputs, textarea, and the submit button.
Horizontal overflow	Responsive sizing and horizontal overflow protection were added so content stays inside the viewport.
Visual consistency	The existing identity was preserved: Space Grotesk headings, Inter body text, Deep Burgundy #6B1F2A, Ink #171717, and Warm White #F7F5F2.

2. Functional verification

The portfolio was opened on a real mobile phone. The submitted mobile screenshots show the identity section and contact form fitting within the viewport without visible horizontal overflow. The user also tested the LinkedIn, GitHub, and Email links and confirmed that they work. The contact form was tested successfully and an email could be sent.

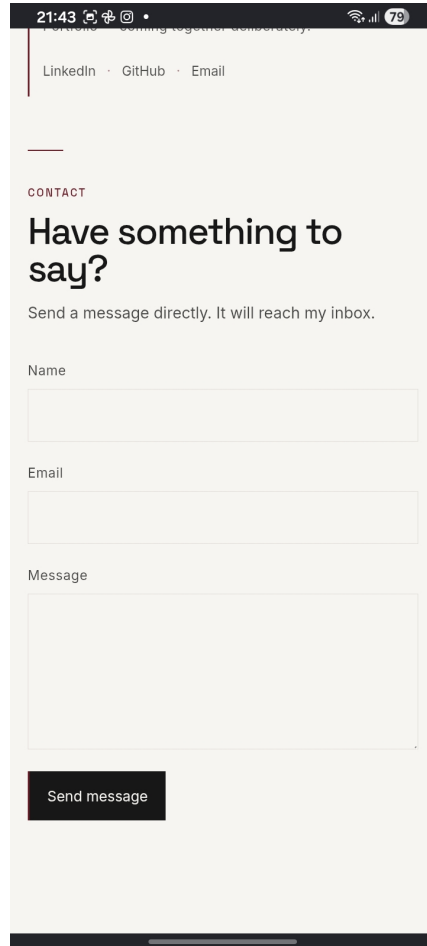

Check	Result
Real mobile phone test	PASS — completed
Mobile layout / no visible overflow	PASS
Readable text and form layout	PASS
LinkedIn link	PASS — tested
GitHub link	PASS — tested
Email link	PASS — tested
Contact form	PASS — email sent successfully

3. Before / after notes

Before: The desktop-oriented styling had relatively compact form controls and link interaction areas, with less explicit protection for narrow mobile layouts.

After: Mobile spacing is responsive, form controls are easier to read and tap, link tap areas are larger, focus states are clearer, and horizontal overflow is explicitly prevented.

4. Evidence

Mobile verification screenshot captured after the responsive fixes.

5. Submission package

Submit this PDF as the fix-log document, attach the mobile verification screenshot if the assignment portal allows separate attachments, and provide the live portfolio URL in the submission field. A separate before screenshot is not required by the brief; it is described as ideal evidence.
